How to install [Orange 5 V1.34](#) Windows 8.1/7/XP:

Video: <https://youtu.be/Dn4JEqOA6WY>

Very easy to install:

Step 1: Install Orange 5 driver

Open Orange 5 software CD

Copy orange5v1.34 folder to desktop

Connect Orange 5 USB programmer with laptop

select "Install from a list or specific location (Advanced)"

Click Next

Browse and save file to

C:/Documents and Settings/Administrator/Desktop/orange5v1.34/Driver

Click Next

If the system prompts "Cannot Start this Hardware" . Press Finish to continue.

Open My Computer->Manager->Device Manager

Unplug Orange 5 USB cable then replug, you will see the driver is working

Step 2: Run Orange5 self test

Open orange5v1.34 folder on desktop

Open Orange5 setup

Select Options tab->Programmer Options, press Test

Orange Test passed. Hardware OK.

Step 3: Read & Write EEPROM

Select ECU configuration EEPROM

Select Group and Chip ,press Ok

Select Read icon

(Note: select the correct chip)

Read chip data complete

Save data

Click Write icon

Write chip (i.e 93LC66

Save data

Open data just read

click Write icon

Re-write 93LC66 to chip

[Orange 5 programmer](#) test reports:

2j74y ok

35080 ok

TMS IMMO Opel ok

Hc05 IMMO old VW ok

All functions open 1-10 except car radio get error, tested reading usual EPROMS all good. tested IMMO login code from dump, TMS VW works.

Already did few cars. IMMO SW included and also activation for other sw. No problem till now , of course I not test all but with some NEC all ok .

Everything works as it should, knock on wood. Not sure is there any script but software for IMMO, radio and dash coming together with clone.

Can extract the dump of an EEPROM with a programmer and modify it with the software came with the Orange.

Check in hc05b8, hc11e9 EEPROMs. All read and write very fast.

Have 4 secured MCU and they work ok. On Hc908az60 secured and on 68hc11 it work' s just perfect.

Tested with 1j35d, 4j74y, 1d69j, 0d69j, 0f82b, 3k91d, TMS 370c702 OK!

[Orange 5 reviews:](#)

I have it for a long time and for now everything is working properly. One of the few clones that works well and **works as an original**. Some adapters are not supplied and must be purchased separately

So far its **reading and writing** (with verify) all eeproms i try. Good tool so far.

I like **PIN checking** function (test insertions) very much .It saved my job a lot of time.

Great programmer. All that is stated works. If the speed of exchange is not important, you can do a lot. Many **good calculators**

It' s almost the same as the price on the Orange website. Besides - on the webpage is written OEM.

Clone but includes - Immo HPX 9V0

confirmed that oem orange 5 comes with immo hpx 9.0 and adapter set

On **Hc908az60** secured it work' s good.

I have **4 secured mcu**, and they work ok.

I have tried **68hc11**, a lot of eeproms, and it work' s just perfect.

I have it 5.7 too and **work perfect iven on win 10 x64..cas4-cas4+** and many more done no problem.. I also want to buy orange5

I have just bought orange 5 programmer and all seems to **work well happy**

I got fed up with my genuine upa usb s programmer which didn' t seem to want to read anything, it went through the motions and said success reading a load of zeros gavel

Straight out of the box this Orange 5 clone read and write **eeeproms 95640 and 95P08C3** in circuit no problem with no errors, but I had to make sure that my connections to the chip via test clip were all good and then tool work like charm nerd

TIP: Orange 5 Original vs Clone:

Do not get confused by Orange pricing. Orange charge separately for the device, the immo software, the airbag software and the radio software, plus a few specials.

All this comes with the clone.

To compare the two, you must add up all the costs from Orange. There is a very large saving if you buy the clone. But you cannot update it and

you have no support from Scorpio. It will suit some people for sure. The adapters are poor quality, and for many the hardware does not work. No doubt as time goes by will will see huge threads about how to fix them. The company who makes it does not have a good reputation for quality or support.

I do not regret buying [original Orange5](#) and [Tango key programmer](#). But when I did there were no clones available as an alternative.

As for the Tango clone, it' s PCB and components are nothing like the original, and of a very poor quality. I have not seen inside an Orange5 clone yet.

BTW:

Orange5 original price: US\$1,299

Orange 5 clone price: US\$179

You make your choice.
